

Flashcards for Studying: Introduction to Linux

Card 1: Linux File System Basics

Q: How is the Linux file system organized?

A: As a hierarchy starting from the root directory (/), with directories like /home (user directories), /bin (essential binaries), and /etc (configuration files).

Card 2: File Types in Linux

Q: What are the main file types in Linux?

A: Regular files, directories, and special files (e.g., device files, sockets).

Card 3: File and Directory Commands

Q: What does the `ls` command do?

A: Lists files and directories. Example: `ls -l` shows a detailed listing.

Card 4: File Content Commands

Q: How can you view the content of a file?

A: Use `cat` to display the content or `head/tail` to view the start or end of the file.

Card 5: Redirection Operators

Q: What is the purpose of the `>` operator in Linux?

A: Redirects output to a file, overwriting its content. Example: `echo "Hello" > file.txt`.

Card 6: Pipe Operator

Q: What does the `|` operator do?

A: Connects the output of one command to the input of another. Example: `ls | grep "file"`.

Card 7: File Permissions

Q: How do you view and set file permissions?

A: Use `ls -l` to view permissions. Use `chmod` to change them. Example: `chmod 755 file.txt`.

Card 8: Network Commands

Q: What command is used for secure remote login in Linux?

A: `ssh`. Example: `ssh user@server_address`.

Card 9: Shell in Linux

Q: What is a shell in Linux?

A: A command interpreter for interacting with the OS. Common shells include Bash, Zsh, and Ksh.

Card 10: Shell Variables

Q: What are the types of shell variables?

A: Local variables (exist within a session/script) and environment variables (available globally).

Card 11: Wildcard Symbols

Q: What does the * wildcard do in Linux?

A: Matches any number of characters. Example: `ls *.txt` lists all .txt files.

Card 12: Meta Characters

Q: What does && do in Linux?

A: Runs the next command only if the previous one succeeds. Example: `mkdir new_folder && cd new_folder`.

Card 13: Command Line Arguments

Q: How are command-line arguments used in scripts?

A: Accessed using \$1, \$2, etc. Example: `./script.sh arg1 arg2`.

Card 14: Read and Echo Commands

Q: How do read and echo work in Linux?

A: read takes user input; echo outputs text. Example:

```
read name
echo "Hello, $name!"
```
